

Working on this group assignment went pretty well. The code I implemented was the two players competing for the highest score. The other code I implemented was the Binary search to validate both words. For example if the word is found, it prints that the word is valid; otherwise, it tells the player that the word was not found in the word list. The other piece of code I implemented was seeing which word between player 1 and 2 was longer. It determines if either player submits an invalid word, the other player wins by default, and if both words are invalid, no winner is declared for that round. Overall it was a fun group project to work on
